

2025 英语组国际传播综合能力赛项样题

省赛综合能力分赛项笔试样例

Part I Read and Know

参考校赛赛题样例，省赛文本难度较校赛有所增加。

Part II Read and Reason

参考校赛赛题样例，省赛文本难度较校赛有所增加。

Part III Read and Question

Questions 17-22

Directions: Read two texts about “not knowing” and answer the questions.

Text A

I’m going to give you three options. You’ll only be OK with one of them, and one of the other two is going to nudge you a little closer to madness. Ready?

Here they are:

1. I am not going to give you an electric shock.
2. I am definitely going to give you an electric shock.
3. I might give you an electric shock.

While it goes without saying which one you’re OK with, which of the other two is starting to make the skin on your forearms itch a little? According to the results of a study, it’s probably not No. 2 (though that’s not going to make me any friends). Rather, it’s what’s behind door No. 3 that stirs up the bats in your belfry, because when we’re facing outcomes imbued with uncertainty, it’s the fact that something bad might happen that gets us.

Researchers recruited 45 volunteers to play a computer game in which they turned over digital rocks that might have snakes hiding underneath. Throughout the game, they had to guess whether each rock concealed a snake, and when a snake appeared they received a mild but painful electric shock on the hand. Over the course of the game, they got better about predicting under which rocks they’d find snakes, but the game was designed to keep changing the odds of success to maintain ongoing uncertainty. In other words, they could only get marginally good at guessing before getting knocked off their game, again and again and again.

In the background, the researchers were running a sophisticated computational learning model to estimate the volunteers’ amount of uncertainty that any given rock was concealing a snake. At the same time, their stress was being monitored via instruments gauging pupil dilation and perspiration.

As it turned out, the volunteers' level of uncertainty correlated in lockstep with their level of stress: If someone felt "certain", he or she would find a snake (100% probability that a snake lived there), their stress was significantly lower than if they felt like maybe a snake lived here. In both cases, they'd get a shock, but their stress was jacked with added uncertainty. "Using our model we could predict how stressed our subjects would be not just from whether they got shocks but from how much uncertainty they had about those shocks," said lead author Archy de Berker of the UCL Institute of Neurology. "Our experiment allows us to draw conclusions about the effect of uncertainty on stress. It turns out that it's much worse not knowing you are going to get a shock than knowing you definitely will or won't."

What I like about this study is that it touches on a massive swath of life: We evolved to respond this way to uncertainty for excellent reasons—namely, the thing that might be lurking behind that rock or bush or up in that tree could harm, kill, or quite possibly eat us. Our brains are adaptively wired to react this way from far back in our ancestral history. Just because we've launched ourselves (and our brains) into this techno-socially advanced era doesn't mean our brains are reacting less or even differently; they are just reacting to different threatening possibilities—some physical and many more perceptual.

Those perceptual, intangible uncertainties are arguably worse because they morph into different forms in our heads the more we think about them. The world has its monsters, no doubt, but we create many times more in the boundless space of our minds—not to mention the space of minds connected. And this has much to do with crippling fear and anxiety, numbing substance abuse, the appeal of authoritarian leaders, and a host of other topics for another day—all rooted back to the brain's insatiable craving for certainty.

Text B

It is a good idea to forget many of the things you have learned over the years. Some are outmoded, some incorrect, some too obvious and trite. We also need a fresh approach to things of interest, to see them as if for the first time, to attain "beginner's mind". This approach would help make a thing "strange".

Years ago, when I kept coming across the idea that knowledge is not a good thing, I used to wonder if this was anti-intellectualism. But I kept finding the idea in the work of many brilliant thinkers that I admired. I loved to read and study, and I knew they did. So why were they so negative about knowledge? Here is poet David Hinton's translation of Chapter 71 of *Tao Te Ching*:

Knowing not-knowing is lofty.

Not knowing not-knowing is affliction.

Let me go over this beautiful translation as I understand it: If you know the importance of not knowing everything, or anything for that matter, you are

way ahead. You know the most important thing. If you don't appreciate the importance of not knowing everything, you are going to have problems. You will be under the dangerous illusion that you know what life is all about. You will have banished the mysteries that are so important. You will be full of ego, thinking that you know what you are talking about, when in fact you are only defending against your ignorance. The starting point toward wisdom is to acknowledge your basic ignorance, your not-knowing.

Let's delve into the phrase "beginner's mind". You can always find a frame of mind in which you are a beginner, maybe once again. You keep coming back to the role of student and novice, open to learning because there is something you know you do not know. How fruitful that attitude is. But you could discover it in any situation, acknowledging and appreciating the extent to which you don't know something. Sometimes achieving it may require a little bruising to the ego, but that is always a good thing.

When you cultivate not-knowing along with learning, you also allow room for mystery, for the profound and inexplicable parts of life that give you a sense of awe. An appreciation of the unknowable keeps you honest and humble in the best way. The truly wise person knows how important it is not to know everything.

I sometimes find myself giving a lecture or speaking in an interview when I know I don't know at all what I am talking about. Usually, that is because the topic is unknowable. I often speak about the soul, for instance, yet after years of study I still don't know just what the soul is.

The trouble with some teachers and leaders is not that they don't know what they are talking about, but that they don't know that they don't know what they are talking about. They go on blissfully using words that even they do not really understand, but they think they do, or at least talk as if they do.

The solution is to admit to our ignorance and try to clear our minds of preconceptions. These are Thoreau's recommendations. Try to forget what you think you know. Don't rely on authorities, but simply be in the presence of whatever it is you are concerned with. Finally, aim for "total comprehension" and not just acquaintance.

17. According to Text A, which of the following contributes more to stress levels?

- A. Certainty of a positive outcome.
- B. Certainty of a negative outcome.
- C. Uncertainty of a positive outcome.
- D. Uncertainty of a negative outcome.

18. According to Text A, how does uncertainty influence human brains?

- A. It provides a higher level of excitement as humans evolve.
- B. It triggers an instinctive stress response due to potential threats.

- C. It minimizes the tendency to generate imaginary threats.
- D. It amplifies the stress response if physical pain is involved.

19. According to Text B, what does David Hinton's translation of *Tao Te Ching* suggest?

- A. Proper knowledge can lead to wisdom and enlightenment.
- B. Self-knowledge of not-knowing may sometimes cause pain.
- C. Lack of knowledge can be beneficial to an individual at times.
- D. The interpretations of knowledge vary from person to person.

20. According to Text B, how can one benefit from a "beginner's mind"?

- A. It enables one to learn new things faster and more efficiently.
- B. It enables one to prove their intellectual superiority over others.
- C. It helps one to avoid being disillusioned or disappointed in life.
- D. It helps one to maintain great curiosity and keep exploring.

21. Which of the following statements is true concerning the two texts?

- A. One of them holds that having much knowledge is beneficial.
- B. Both of them have mentioned the benefit of certainty.
- C. One text tells us that uncertainty contributes to human progression.
- D. The common theme of the two texts is the wisdom of embracing uncertainty.

22. Which of the following questions can be answered using information from **BOTH** of the two texts:

① How can uncertainty influence human perception?

② Why is it necessary to delve into uncertainty?

A. Only ①.

B. Only ②.

C. Both ① and ②.

D. Neither ① nor ②.

Part IV Translate and Connect

Translate the following passage into English.

新质生产力是以创新为主导、符合新发展理念的先进生产力，摒弃损害、破坏生态环境的发展模式，改变过度依赖资源环境消耗的增长方式，推动经济社会发展

绿色化、低碳化，促进经济高质量发展与环境高水平保护协同发展，实现人与自然和谐共生。

Part V Write and Create

参考校赛赛题样例，省赛难度较校赛有所增加。

参考答案：

Part I Read and Know

(略)

Part II Read and Reason

(略)

Part III Read and Question

17. D; 18. B; 19. C; 20. D; 21. C; 22. A

Part IV Translate and Connect

(略)

Part V Write and Create

(略)
